Intake Air Temperature

Replacing the stock intercooler with the AWE Tuning intercooler, in conjunction with a performance software flash, dramatically reduces intake air temperatures as measured at the intercooler outlet. Maximum averaged temperature drop was measured at 30 degrees F @ 6100 rpms. The increased efficiency of the AWE Tuning intercooler also produces intake air temperatures that drop as engine rpms climb.

All tests were conducted on 93 octane pump fuel in controlled ambient conditions. Published results are representative of all recorded valid tests.
